

THE NEW WAY OF
SCREEN INSERTION

VAN DER VALK

ValkScreenVision

screen insertion system

Van der Valk Horti Systems is introducing a new screen insertion system. It saves time when inserting or replacing screen cloths and is less risky for both crop and installer. As the screen cloth is inserted directly into the profile, there is no need to use clips. As a result hardly any work is required amongst the crop nor at great heights.

As well as being quick, clean and safe, the system is also flexible. It is suitable for every type of screen and can be obtained from a large group of screen installers and greenhouse builders. In other words: this new insertion system gives you certainty for now and in the future.

Quick

Automatic screen insertion, without clips

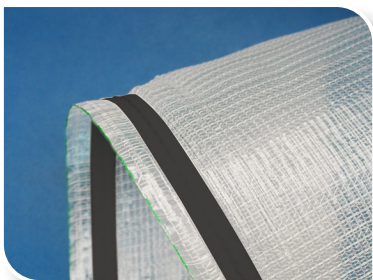

A specially developed tailoring machine fits the screen cloth with flexible, flat guide strips. During insertion, these strips slide through the associated chambers in the aluminium screen profiles and truss profiles without the screen cloth having to enter the chamber. The system owes its quick, easy action to this unique invention.

Clean

Insert screen just before planting

With its efficient method, screen cloths can be mounted at a later time. This provides the great advantage that the screens will be less contaminated by dust during construction. This can easily lead to 1% more light coming through. A benefit that recurs every day anew.

Flexible

Free choice of screen and installer

The universal screen securing system is suitable for every type of screen cloth. There is also a wide choice of screen installers and greenhouse builders who provide this system. By choosing this system, you have the freedom to review your options again when changing the screen cloth in the future. After all, you never know what the future may hold.

Included with ValkScreenVision

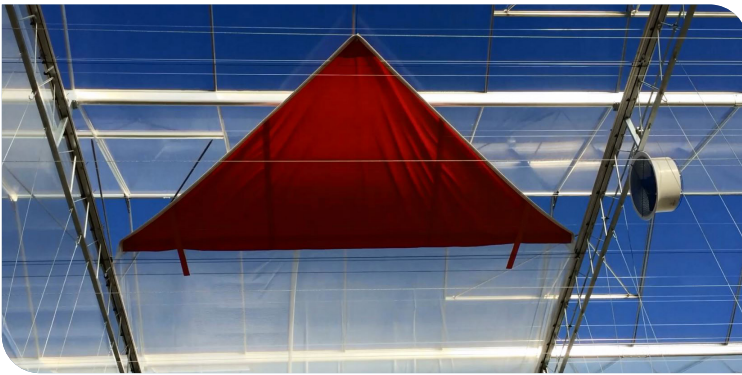

Auxiliary screen

For an optimal installation of the screen cloth, we developed an auxiliary cloth in the shape of a triangle. It enables the screen cloth to be inserted at its full width without tension, preventing the formation of unwanted folds.

The triangle is easy to affix to the screen cloth with a specially developed and patented connection method. After use, the triangle can simply be detached and used immediately for inserting the next stretch of screen cloth.

Tailoring machine

For this system Van der Valk Horti Systems specially developed a tailoring machine, which fits any kind of screen cloth with guide strips. Thanks to this revolutionary machine, the guide strips can be attached with great precision, thus ensuring quality and reliability.

Projects

The realization of the first projects with **ValkScreenVision** was successful. The installation went according to plan, and both grower and installer were satisfied.

WHY VAN DER VALK HORTI SYSTEMS?

- The only company in the world specialising exclusively in the development and production of ventilation mechanisms and screen systems
- Engineering and production are both in house
- Innovative systems with distinctive benefits for growers
- Quick and reliable deliveries due to our modern machinery and large stocks
- Technical, commercial and project support provided by enthusiastic staff
- Quick and efficient mounting using unique, well designed and high-quality components
- System supplier since 1963
